## Before there was D1D or D1X, there was DQ1.

In 1977, Intel's microprocessor group got its start in Oregon in a small office across the street from a local Dairy Queen. The team – fond of acronyms even then – dubbed the space “DQ1.”

It's doubtful the engineers of the day envisioned Intel's presence in Hillsboro growing to include enormous facilities like the modern D1D or D1X microprocessor fabrication plants. But that's what happens in a city that supports businesses both large and small. They tend to grow.

**Business goes where business grows.**
